

It is the policy of SANOVO FOODS A/S not to buy genetically modified eggs. Through our purchase specifications we demand our suppliers of eggs and egg products only to deliver products which have not been genetically modified.

After a thorough search of the current scientific literature on the passage of GMO to mammalian cells e.g. fowls, from genetically modified feeds, we found among others the following message from the Joint FAO/WHO Expert Consultation report on Foods Derived from Biotechnology (June 2000):

[“It was concluded that the data do not demonstrate that plant DNA can be transferred to and maintained in mammalian cells.”](#) (§6.2)

Based on the available scientific evidence we can honestly make the statement:

“To the best of our knowledge, our egg and egg products do not contain any Genetically Modified Organism”.

Should you wish any further information related to this issue please do contact us.

Best regards
